

COSC 2011 Section N

Tuesday, March 13 2001

Overview

- Assignment 1 Notes
- Array Based Implementations
 - ◆ “Wrap-around” Queue, Vector, Sequence
- Linked Lists
 - ◆ “Singly” & “Doubly” Linked
 - ◆ Stack, Queue, Dequeue, “List”

2001-03-15

1

Sequence: Array (1)

- Represent a *position* p with a new object:
 - ◆ Each array element stores one object.
 - ◆ Each object holds an element and an index i .

2001-03-15

COSC 2011
Section N

2

Array Based Implementations: Queue

- ◆ Each time we increment f or r , compute the increment as:

$$f = (f + 1) \bmod N$$

$$r = (r + 1) \bmod N$$

- ◆ Now have $O(1)$ time enqueue and dequeue
- ◆ Insists that Q can never hold more than $N-1$ elements.
- ◆ Computing Size of the Queue:

$$(N - f + r) \bmod N$$

2001-03-15

COSC 2011
Section N

3

Assignment 1 Notes: (1)

- Class Invariant:
 - ◆ How the variables represent the data structure
 - ◆ Assertion which should hold after initialization
 - ◆ Should be preserved by the operations on the data structure.
 - ◆ E.g. Stack has top variable:
 - ★ Initialized to -1 .
 - ★ $S[\text{top}]$ always refers to the top element.

2001-03-15

COSC 2011
Section N

4

Assignment 1 Notes: (2)

- Assertions:
 - ◆ A logical condition that is assumed to hold at some point of program execution.
 - ◆ Precondition:
 - ★ Some condition before the start of execution.
 - ★ May not have any!
 - ◆ Postconditions:
 - ★ If precondition is true and code is executed, these conditions will now hold:

2001-03-15

COSC 2011
Section N

5

Assignment 1 Notes: (3)

- Notation:
 $\{P\} \rightarrow S \rightarrow \{Q\}$

If *precondition* P is true before execution of statements S, then the *postcondition* Q will be true after execution.

2001-03-15

COSC 2011
Section N

6

Sequence: Array (2)

- When inserting:
 - ◆ Need to shift position objects to make room for new position
- When deleting:
 - ◆ Shift position objects to fill hole created by removal of old position.
- $O(N)$ Time when inserting or deleting!

2001-03-15

COSC 2011
Section N

7

Sequence: Comparison (1)

- Comparison of Sequence Implementations:
 - ◆ Array vs. Linked List

Operations	Array	List
size, isEmpty	$O(1)$	$O(1)$
atRank, rankOf, elemAtRank	$O(1)$	$O(n)$
first, last	$O(1)$	$O(1)$
before, after	$O(1)$	$O(1)$
replaceElement, swapElements	$O(1)$	$O(1)$
replaceAtRank	$O(1)$	$O(n)$
insertAtRank, removeAtRank	$O(n)$	$O(n)$
insertFirst, insertLast	$O(1)$	$O(1)$
insertAfter, insertBefore	$O(n)$	$O(1)$
remove	$O(n)$	$O(1)$

2001-03-15

COSC 2011
Section N

8

Sequence: Comparison (2)

- Array imp. is superior for ranked based operations
 - ◆ `atRank`, `rankOf`, `elemAtRank`
 - ◆ Equal to linked list with other access methods.
- Linked list is superior for position based operations
 - ◆ `insertAfter`, `insertBefore`, `remove`.
- Linked list is superior for space usage!
 - ◆ $O(n)$ vs. $O(N)$

2001-03-15

COSC 2011
Section N

9

Vector: Array (1)

- Obvious Choice:
 - ◆ Use array `A` where `A[i]` stores reference to element with rank `i`.
 - ◆ Choose array size `N` large!
 - ◆ Maintain number of elements `n < N` in array.
 - ◆ Need to shift elements in the array “up or down” to keep array cells contiguous.

2001-03-15

COSC 2011
Section N

10

Vector: Array (2)

- Method Implementations:

```
Algorithm insertAtRank(r,e):
for i = n - 1, n - 2, ..., r do
  S[i+1] ← S[i]
S[r] ← e
n ← n + 1
```

```
Algorithm removeAtRank(r):
e ← S[r]
for i = r, r + 1, ..., n - 2 do
  S[i] ← S[i + 1]
n ← n - 1
return
```

2001-03-15

COSC 2011
Section N

11

Vector: Array (3)

- ◆ How about `elemAtRank(r)`?
- ◆ When inserting or deleting:
 - ★ Shift elements up or down to keep array cells contiguous!
 - ★ Needed to maintain rule of always storing an element of rank `I` at index `i` in `A`.

2001-03-15

COSC 2011
Section N

12

Vector: Array (4)

- Running Time of Several Methods:

Method	Time
size	$O(1)$
isEmpty	$O(1)$
elemAtRank	$O(1)$
replaceAtRank	$O(1)$
insertAtRank	$O(n)$
removeAtRank	$O(n)$

- insertAtRank(r, e): Worst case running time when $r = 0$.
- removeAtRank(r, e): Worst case running time when $r = 0$.

2001-03-15

COSC 2011
Section N

13

Vector:Extendable Array (1)

- Regular Array Implementation Assumes Fixed Capacity!
 - ◆ Defeats the purpose of vector.
 - ◆ Waste of space or lack of space!
- Easy, Why not *Grow* the Array!
 - ◆ Array capacity in Java is fixed – **Can't grow Array.**

2001-03-15

COSC 2011
Section N

14

Vector:Extendable Array (2)

- When *Overflow* occurs:
 1. Allocate new array of size $2N$.
 2. Copy $A[i]$ to $B[i]$, for all between 0 and $N - 1$
 3. Let $A = B$. Now B supports the Vector.
 - ◆ This is an Extendable Array.
 - ★ Extend the original array to make room for more elements.
 - ★ Can grow by any size, not necessarily N , $2N$ etc.

2001-03-15

COSC 2011
Section N

15

Vector:Extendable Array (3)

- Increasing the Array Size:
 - ◆ May seem slow since.
 - ◆ After array size is increased by N , space for an additional N elements.
 - ◆ Running time on a series of operations on an initially empty vector is actually quite efficient!

2001-03-15

COSC 2011
Section N

16

Singly Linked Lists (1)

- Definition:
 - ◆ Collection of *nodes* forming a linear ordering.
 - ◆ Ordering is determined as “Follow the Leader”
 - ◆ Each node stores a reference to an element and a reference, called *next*, to another node.

2001-03-15

COSC 2011
Section N

17

Singly Linked Lists (2)

- ◆ *null* object denoted by \emptyset and is pointed to by last node indicating end of list.
- ◆ “*head*” reference is a single instance variable.

2001-03-15

COSC 2011
Section N

18

Singly Linked Lists (3)

- *next* Reference:
 - ◆ *Link* or *pointer* to another node.
- *Link Hopping*:
 - ◆ Moving from node to node, using next pointer.
- *Head*: First node in list.
- *Tail*: Last node in list and has a null next pointer.

2001-03-15

COSC 2011
Section N

19

Singly Linked Lists (4)

- As an array, keeps the elements in a certain linear order
- No fixed size
 - ◆ Uses space proportional to the number of its elements.
 - ◆ Space usage: $O(n)$
- Insert/Delete element at the head of the List in $O(1)$ time.

2001-03-15

COSC 2011
Section N

20

Singly Linked Lists (5)

- Inserting at head of list:
 - ◆ Create a new node.
 - ◆ Set its *next* pointer to refer to same object as current head of list.
 - ◆ Set the head of list to point to new node.
- Inserting at tail of list:
 - ◆ Create a new node.
 - ◆ Set its *next* pointer to null.
 - ◆ Set next pointer of tail to point to new node.
 - ◆ Assign tail reference to new node.

2001-03-15

COSC 2011
Section N

21

Singly Linked Lists (6)

- Deleting a Node:
 - ◆ Can't delete the tail node in $O(1)$ time.
 - ★ Need to access node before the tail!
 - ★ Only way to do this, is to start from head of list and traverse entire list.

2001-03-15

COSC 2011
Section N

22

Linked List: Stack (1)

- Implementation:
 - ◆ Top of stack can be head or tail of list
 - ★ Since we can insert & delete at the head of list, make head the top .
 - ◆ Space Requirement: $O(n)$
 - ◆ No space limitations (bounded only by memory).

2001-03-15

COSC 2011
Section N

23

Linked List: Queue (1)

- Implementation:
 - ◆ Front of queue where we delete only is head of list.
 - ◆ Rear of queue where we insert elements is the tail.
 - ◆ Efficient! $O(1)$ time.
 - ◆ Why not insert at the at the head and remove at the tail?
 - ◆ Need references to head and tail of the list.

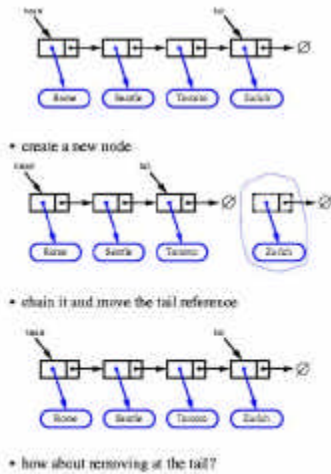

2001-03-15

COSC 2011
Section N

24

Linked List: Queue (2)

- Inserting at tail of list:

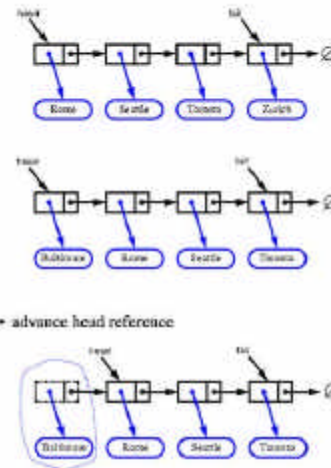

2001-03-15

COSC 2011
Section N

25

Linked List: Queue (3)

- Removing at head of list:

2001-03-15

COSC 2011
Section N

26

Doubly Linked Lists (1)

- Allows for a great variety of operations:
 - ◆ Insertion & deletion at both ends of list in $O(1)$.
- Node stores 2 references:
 - ◆ *next* link – points to the next node in the list
 - ◆ *prev* link – points to the previous node in the list.

2001-03-15

COSC 2011
Section N

27

Doubly Linked Lists (2)

- Add special nodes at both ends of list which do not store any element:
 - ◆ *header* node just before the head of the list.
 - ★ Valid *next* reference.
 - ★ null *prev* reference.
 - ◆ *trailer* node just after the last node of the list.
 - ★ Valid *prev* reference.
 - ★ null *next* reference.

2001-03-15

COSC 2011
Section N

28

Doubly Linked Lists (3)

- Example:

2001-03-15

COSC 2011
Section N

29

Doubly Linked Lists (4)

- Inserting & removing at either end in $O(1)$ time:
 - ◆ *prev* pointer eliminates need to traverse list to find node just before tail.
- Inserting & deleting anywhere else in list:
 - ◆ Simply a matter of changing the pointers!

2001-03-15

COSC 2011
Section N

30

Doubly Linked Lists (4)

- List ADT with doubly linked list:
 - ◆ Make nodes implement position interface
 - ★ define method `element()` which returns element stored at node.
 - ◆ Nodes act as positions.
 - ★ Viewed internally by list as nodes but on the outside as positions.

2001-03-15

COSC 2011
Section N

31

Doubly Linked Lists (5)

- In the internal node view:
 - ◆ Each node has instance variables *prev* and *next*
 - ★ Refer to predecessor and successor nodes respectively.
 - ◆ Given position `p` we cast it to a node.
 - ★ Once we have node, can implement for example, `before(p)` by returning the `prev` reference.

2001-03-15

COSC 2011
Section N

32

Doubly Linked Lists (6)

- Supports object oriented approach additional time & space overhead:
 - ◆ Hides implementation details from user.
 - ◆ Aids in code reuse since user doesn't know that the position objects are actually treated as nodes!
 - ◆ See text book for pseudo code and Java Code!

2001-03-15

COSC 2011
Section N

33

Doubly Linked Lists (7)

- Inserting element into list:

- the list before insertion:

- creating a new node for insertion:

2001-03-15

COSC 2011
Section N

34

Doubly Linked Lists (8)

- Removing element from list:

- the list before deletion:

- deleting a node:

- after deletion:

2001-03-15

COSC 2011
Section N

35
