

Administrative Notes

- Mid-Term Test
 - Thursday, July 27 2006 at 11:30am
 - No lecture before or after the mid-term test
 - You are responsible for material presented in the lectures not necessarily covered in the textbook

Administrative Notes

Copyright © 2005 Elsevier

- Mid-Term Test (cont.)
 - Will cover chapters1-6
 - Chapter 1: complete
 - Chapter 2: chapter introduction and Section 2.1
 - Chapter 3: entire chapter except Section 3.5.1, 3.5.2, 3.3.4 and 3.3.5
 - Chapter 5: entire chapter
 - Chapter 6: chapter introduction & Section 6.1 (complete)

Administrative Notes

- · Assignment One
 - Due date: Friday, July 28 2006 at 1:00pm
 - Submit your assignment in the drop-box located at the Computer Science and Engineering undergraduate office
 - Late assignments are subject to a penalty of 10% each day
 - I may choose to mark only a subset of the assigned questions
 - You must "show your work" where appropriate to obtain full marks

Copyright © 2005 Elsevie

Administrative Details

- · Drop Deadline
 - Computer Science Department drop-deadline for the course is July 31 2006
 - If you wish to drop the course before this deadline will have to petition to "drop late" as far as the registrars office is concerned, the drop deadline has passed (they treated the course as D2 - see registrars office)

• Of course, the petition will have the support of the department and of myself as well and will be approved under these circumstances

Review

Convright @ 2005 Elsevi

- What is an expression ?
- What is a statement ?
- What are the seven control flow paradigms ?
- What are prefix, postfix operators ?
- What are precedence rules and why are the important ?
- What is the only way to ensure precedence results in exactly what we "meant" ?
- In which language do all operations have the same precedence ?

Review

- What is short-circuiting ?
- What are the benefits of short-circuiting ?
- It is orthogonality and what are its benefits ?
- Describe the difference between expression oriented and statement oriented languages
- What is a side-effect ?
- Do imperative languages allow side-effects ?
- Is associtivity safe ? How about commutativity ?
 Instruction of the second second

Control Flow

- Basic paradigms for control flow:
 - Sequencing
 - Selection
 - Iteration
 - Subroutines, recursion (and related control abstractions, e.g. iterators)
 - Nondeterminacy
 - Concurrency

Copyright © 2005 Elsevier

Selection

Selection

- sequential if statements

Selection

• Selection

- Fortran computed gotos
- jump code
 - for selection and logically-controlled loops
 - no point in computing a Boolean value into a register, then testing it
 - instead of passing register containing Boolean out of expression as a synthesized attribute, pass inherited attributes INTO expression indicating where to jump to if true, and where to jump to if false

Copyright © 2005 Elsevier

Selection

- Jump is especially useful in the presence of short-circuiting
- **Example** (section 6.4.1 of book):

if ((A > B) and (C > D)) or (E <> F)
then
then_clause
else
else_clause

Selection • Code generated w/o short-circuiting (Pascal) -- load rl := A r2 := B r1 := r1 > r2 r2 := C r3 := D r2 := r2 > r3 rl := rl & r2 r2 := E r3 := F r2 := r2 \$<>\$ r3 r1 := r1 \$|\$ r2 if r1 = 0 goto L2 Ll: then_clause -- label not actually used goto L3 L2: else_clause S. R. L. L3 : Copyright © 2005 Elsevier

Selection		
• Code generated w/ short-circuiting (C)		
	r1 := A	
1	r2 := B	
	if r1 <= r2 goto L4	
	r1 := C	
1	r2 := D	
1	if r1 > r2 goto L1	
L4:	rl := E	
1	r2 := F	
	if r1 = r2 goto L2	
L1:	then_clause	
	goto L3	
L2:	else_clause	
L3:		10/00/00/00
1		- 10 Tak

Iteration

- Enumeration-controlled
 - Pascal or Fortran-style for loops
 - · scope of control variable
 - changes to bounds within loop
 - changes to loop variable within loop
 - value after the loop

Copyright © 2005 Elsevier

Iteration

- The goto controversy
 - *assertion*: gotos are needed almost exclusively to cope with lack of one-and-a-half loops
 - early return from procedure
 - exceptions
 - in many years of programming, I can't remember using one for any other purpose
- except maybe complicated conditions that can be separated into a single if-then-else because of the need for short-circuiting

Recursion

- Recursion
 - equally powerful to iteration
 - mechanical transformations back and forth
 - often more intuitive (sometimes less)
 - naïve implementation less efficient
 - · no special syntax required
 - fundamental to functional languages like Scheme
