EECS
MATH1090. Problem Set No1
Posted: Sept. 21, 2015

Due: Oct. 6, 2015, by 2:00pm; in the course assignment box.

It is worth remembering (from the course outline):

The homework must be each individual's own work. While consultations with the instructor, tutor, and among students, are part of the learning process and are encouraged, nevertheless, *at the end of all this consultation* each student will have to produce an individual report rather than a copy (full or partial) of somebody else's report.

The concept of "late assignments" does not exist in this course.

1. (3 MARKS) Prove that no wff ends with the symbol "$\vee$".

Hint. Analyse formula-calculations (best approach), or use induction on formulas.

2. (3 MARKS) Prove that $\vee\vee$ is *not* a substring of *any* wff.

Hint. Analyse formula-calculations, or use exercise 1 (the latter approach is acceptable even if you did not answer 1).

3. (1 MARK) Prove that $((\neg(p \vee q)) \to p)$ *is* a wff.

4. (6 MARKS) Recall that a schema is a tautology iff *all* its *instances* are tautologies.

Which of the following six schemata are tautologies? Show the whole process that led to your answers, *including truth tables or equivalent short cuts, and words of explanation*.

I note that in the six sub-questions below I am *not* using all the formally necessary brackets.

Therefore be mindful of connective priorities and associativities!

- $((A \to B) \to A) \to A$
- $A \wedge B \to A \vee B$
- $A \vee B \to A \wedge B$
- $A \to B \equiv \neg B \to \neg A$
- $A \wedge (B \equiv C) \equiv A \wedge B \equiv A \wedge C$
- $A \vee (B \equiv C) \equiv A \vee B \equiv A \vee C$

Recall that a schema is *not* a tautology iff it has an instance that is not.

5. (3 MARKS) Prove that if for some formulae A and B it is the case that $A, B \models_{\text{taut}} \bot$, then it is also the case that $\models_{\text{taut}} B \to \neg A$.

Here, using truth tables or truth-table tricks, you will show that if you have the left side of the "then" in the statement, then you must have the right side as well.

6. (5 MARKS) By using truth tables, or using related shortcuts, examine whether or not the following tautological implications are correct.

In order to show that a tautological implication that involves *meta*-variables for formulas —i.e., it is a schema— is *incorrect* you *must* consider a special case that *is* incorrect (since some other special cases might work).

Show the whole process that led to each of your answers.

- $p \models_{\text{taut}} p \wedge q$
- $A, B \models_{\text{taut}} A \wedge B$
- $A, A \to B \models_{\text{taut}} B$
- $B, A \to B \models_{\text{taut}} A$
- $p \wedge q \models_{\text{taut}} p$

7. (6 MARKS) Write down the most simplified result of the following substitutions, *whenever the requested substitution makes sense*. Whenever a requested substitution does not make sense, explain exactly why it does not.

Show the whole process that led to each of your answers in each case.

Remember the priorities of the various connectives as well as that of the meta-expression "[$\mathbf{p} := \ldots$]"! The following formulae have not been written with all the formally required brackets.

- $q \vee (p \to p)[q := r]$
- $p \to \top[p := \mathbf{f}]$
- $(p \vee q)[p := \top]$
- $(\bot \to r \to q)[\bot := p]$
- $p \vee q \wedge r[q' := A]$ (where A is some formula)
- $p \vee (q \wedge r)[q := A]$ (where A is some formula)
