## CS345 Notes for Lecture 10/16/96

## Generalization to Unions of CQ's

 $P_1 \cup P_2 \cup \cdots \cup P_k \subseteq Q_1 \cup Q_2 \cup \cdots \cup Q_n$  iff for all  $P_i$  there is some one  $Q_j$  such that  $P_i \subseteq Q_j$ .

## Proof (If)

Obvious.

## Proof (Only If)

Assume the containment holds.

- Let D be the canonical (frozen) database from  $CQ P_i$ .
- Since the containment holds, and  $P_i(D)$  surely includes the frozen head of  $P_i$ , there must be some  $Q_j$  such that  $Q_j(D)$  includes the frozen head of  $P_i$ .
- Thus,  $P_i \subseteq Q_i$ .

#### Union Theorem Just Misses Being False

Consider generalized CQ's allowing arithmetic-comparison subgoals.

 $P_1$ : p(X) :- e(X) & 10 <= X & X <= 20

 $Q_1\colon$  p(X) :- e(X) & 10 <= X & X <= 15

 $Q_2\colon$  p(X) :- e(X) & 15 <= X & X <= 20

•  $P_1 \subseteq Q_1 \cup Q_2$ , but  $P_1 \subseteq Q_1$  and  $P_1 \subseteq Q_2$  are both false.

## CQ Contained in Recursive Datalog

Test relies on method of canonical DB's; containment mapping approach doesn't work (it's meaningless).

- Make DB D from frozen body of CQ.
- Apply program to *D*. If frozen head of CQ appears in result, then yes (contained), else no.

#### Example:

```
Q_1: path(X,Y) := arc(X,Z) & arc(Z,W) & arc(W,Y)
```

 $Q_2$  is the value of path in the following recursive Datalog program:

```
r_1: path(X,Y) :- arc(X,Y)
r_2: path(X,Y) :- path(X,Z) & path(Z,Y)
```

• Freeze  $Q_1$ , say with 0, 1, 2, 3 as constants for X, Z, W, Y, respectively.

$$D = \{arc(0,1), arc(1,2), arc(2,3)\}$$

- Frozen head is path(0,3).
- Easy to infer that path(0,3) is in  $Q_2(D)$  use  $r_1$  three times to infer path(0,1), path(1,2), path(2,3), then use  $r_2$  to infer path(0,2), path(0,3).

#### Harder Cases

- Datalog program ⊆ CQ: doubly exponential complexity. Reference: Chaudhuri, S. and M. Y. Vardi [1992]. "On the equivalence of datalog programs," Proc. Eleventh ACM Symposium on Principles of Database Systems, pp. 55-66.
- Datalog program  $\subseteq$  Datalog program: undecidable.

# CQ's With Negation

General form of conjunctive query with negation (CQN):

$$H : \mathbf{-} \ G_1 \ \& \ \dots \ \& \ G_n \ \&$$
 NOT  $F_1 \ \& \ \dots \ \& \ \mathrm{NOT} \ F_m$ 

- G's are positive subgoals; F's are negative subgoals.
- Apply CQN Q to DB D by considering all possible substitutions of constants for the variables of Q. If all the positive subgoals become facts in D and none of the negative subgoals do, then infer the substituted head.

- $\square$  Set of inferred facts is Q(D).
- Containment of CQ's doesn't change.  $Q_1 \subseteq Q_2$  if for every database  $D, Q_1(D) \subseteq Q_2(D)$ .

## Example:

$$C_1: p(X,Z) := a(X,Y) & a(Y,Z) & NOT a(X,Z)$$
 $C_2: p(A,C) := a(A,B) & a(B,C) & NOT a(A,D)$ 

- Intuitively,  $Q_1$  looks for paths of length 2 that are not "short-circuited" by a single arc from beginning to end.
- $Q_2$  looks for paths of length 2 that start from a node A that is not a "universal source"; i.e., there is at least one node D not reachable from A by an arc.
- We thus expect  $Q_1 \subseteq Q_2$ , but not vice-versa.

### Levy-Sagiv Test

To test  $Q_1 \subseteq Q_2$ :

- 1. Construct the set of basic canonical databases that correspond to all the partitions of the set of variables of  $Q_1$ .
  - ☐ That is, for each partition, assign a unique constant to each block of the partition.
  - □ Create the basic canonical DB by replacing each variable by the constant of its block. The basic canonical DB is the set of resulting *positive* subgoals.
- 2. For each basic canonical DB D constructed in (1), check that:
  - $\square$  If  $Q_1(D)$  contains the frozen head of  $Q_1$ , then so does  $Q_2(D)$ .

Note that unlike ordinary CQ's, it is possible that  $Q_1(D)$  does not contain  $Q_1$ 's head, because D may make a negated subgoal false (i.e., D contains the frozen subgoal without the NOT).

- 3. If  $Q_1(D)$  contains the frozen head of  $Q_1$ , we must then also consider the larger set of (extended) canonical DB's D' formed by adding to D other tuples that are formed from the same symbols as D, but not any of the tuples that are the negated subgoals of  $Q_1$ .
  - Check that if  $Q_1(D)$  contains its frozen head, so does  $Q_2(D')$ .
- 4. If so,  $Q_1 \subseteq Q_2$ ; if not, then not.

**Example:** Consider  $C_1$  above. The variables are  $\{X, Y, Z\}$ .

• There are five partitions of the variables, shown in the table below.

	Partition	Basic Canonical DB $D$
1)	$\{X\}\{Y\}\{Z\}$	$\{a(0,1),a(1,2)\}$
2)	$\{X,Y\}\{Z\}$	$\{a(0,0),a(0,1)\}$
3)	${X}{Y,Z}$	$\{a(0,1),a(1,1)\}$
4)	$\{X,Z\}\{Y\}$	$\{a(0,1),a(1,0)\}$
5)	$\{X,Y,Z\}$	$\{a(0,0)\}$

- In cases (2), (3), and (5),  $C_1(D)$  does not contain its own frozen head.
  - E.g., in case (2), the only substitution that makes the positive subgoals of  $C_1$  true is  $X \to 0$ ,  $Y \to 0$ , and  $Z \to 1$ . But then, the negative subgoal NOT a(X, Z) becomes false, since a(X, Z) = a(0, 1) and a(0, 1) is indeed in D.
- In cases (1) and (4),  $C_1(D)$  contains  $C_1$ 's frozen head, but so does  $C_2(D)$  and any extended canonical DB  $D' \supseteq D$ .
  - E.g., in case (4), the frozen head of  $C_1$  is p(0,0).  $C_2(D)$  contains p(0,0), as we can see from the substitution  $A \to 0, B \to 1$ ,  $C \to 0, D \to 2$ .
  - $\square$  Moreover, adding tuples consisting of 0's, 1's and 2's to D cannot change things as long as we don't add a(0,2), the frozen negative subgoal of  $C_1$ . Then, both

 $C_1(D')$  and  $C_2(D')$  contain  $C_1$ 's frozen head.

**Example:** Consider a slightly different pair of CQ's:

$$C_1\colon \ {\tt p(X,Z)}\ :=\ {\tt a(X,Y)}\ \&\ {\tt a(Y,Z)}\ \&\ {\tt NOT}\ {\tt a(X,Z)}$$
  $C_2\colon \ {\tt p(A,C)}\ :=\ {\tt a(A,B)}\ \&\ {\tt a(B,C)}\ \&\ {\tt NOT}\ {\tt a(C,C)}$ 

- $C_1$  is the same, so the basic canonical DB's are the same.
- However, consider the partition  $\{X\}\{Y\}\{Z\}$ .
- While for the resulting basic canonical DB  $D = \{a(0,1), a(1,2)\}$ , both  $C_1(D)$  and  $C_2(D)$  contain  $C_1$ 's frozen head, the same is not true for the extended canonical DB  $D' = \{a(0,1), a(1,2), a(2,2)\}$ .
