

- If directory fits in memory, equality search answered with one disk access; else two.
 - 100MB file, 100 bytes/rec, 4K pages contains 1,000,000 records (as data entries) and 25,000 directory elements; chances are high that directory will fit in memory.
 - Directory grows in spurts, and, if the distribution *of hash values* is skewed, directory can grow large.
 - Multiple entries with same hash value cause problems!
- Delete: If removal of data entry makes bucket empty, can be merged with ' plit image'. If each directory element points to same bucket as its split image, can halve directory.

Linear Hashing

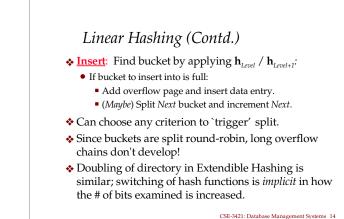

- This is another dynamic hashing scheme, an alternative to Extendible Hashing.
- LH handles the problem of long overflow chains without using a directory, and handles duplicates.
- ♦ Idea: Use a family of hash functions h₀, h₁, h₂, ...
 - **h**_i(*key*) = **h**(*key*) mod(2ⁱN); N = initial # buckets
 - **h** is some hash function (range is *not* 0 to N-1)
 - If N = 2^{*d*0}, for some *d*0, **h**_i consists of applying **h** and looking at the last *di* bits, where *di* = *d*0 + *i*.
 - **h**_{i+1} doubles the range of **h**_i (similar to directory doubling)

Summary

- Hash-based indexes: best for equality searches, cannot support range searches.
- Static Hashing can lead to long overflow chains.
- Extendible Hashing avoids overflow pages by splitting a full bucket when a new data entry is to be added to it. (*Duplicates may require overflow pages.*)
 - Directory to keep track of buckets, doubles periodically.
 Can get large with skewed data; additional I/O if this does not fit in main memory.

CSE-3421: Database Management Systems 18

Summary (Cont.)

Linear Hashing avoids directory by splitting buckets round-robin, and using overflow pages.

- Overflow pages not likely to be long.
- Duplicates handled easily.
- Space utilization could be lower than Extendible Hashing, since splits not concentrated on 'dense' data areas.
 - Can tune criterion for triggering splits to trade-off slightly longer chains for better space utilization.
- For hash-based indexes, a *skewed* data distribution is one in which the *hash values* of data entries are not uniformly distributed!
