Method Detail

removeVowels

```
public static java.lang.String removeVowels(java.lang.String inputString)
```

This method creates and returns a version of the passed string that has been modified such that all of the vowels in the passed string have been removed. For instance, when given the string "hello", this method will return "hll". For the purposes of this method, the characters "aeiouy" shall be considered vowels. In addition, this method also prints (to System.out) the returned value.

Parameters:

inputString - a string of alphabetic characters, without digits or punctuation symbols

Returns:

as stated above
