| colour | PK | |

Query 1.

Show, for each customer (reporting the customer's name), the products by name that come in the customer's favourite colour.

```
select C.cname, P.pname
    from Customer C, Avail_Colours A,
        Product P
    where C.fav_colour = A.colour
    and A.prod# = P.prod#;
```

Query 2.

Show, for each customer (reporting the customer's name), the products by name that *do not* come in the customer's favourite colour.

Query 2. (B)

```
select C.cname, P.pname
    from Customer C, Product P,
         ( select distinct Q.prod#, A.colour
                from Product Q,
                     Avail_Colours A
            except
            select prod#, colour
                from Avail_Colours
         ) as N
    where C.fav_colour = N.colour
      and P.prod# = N.prod#;
```

Query 2. (C)

```
with
    NotAvail (prod#, colour) as (
        select distinct Q.prod#, A.colour
            from Product Q,
                 Avail_Colours A
        except
        select prod#, colour
            from Avail_Colours
select C.cname, P.pname
    from Customer C, Product P, NotAvail N
    where C.fav colour = N.colour
      and P.prod# = N.prod#;
```

Query 3.

List pairs of customers (columns: first_cust#, first_cname, second_cust#, second_cname) such that the two customers own at least two products in common.

```
select distinct C.cust#, C.cname, D.cust#, D.cname
from Customer C, Customer D, Item IC, Item JC, Item ID, Item JD
where C.cust# = IC.cust# and C.cust# = JC.cust# and
D.cust# = ID.cust# and D.cust# = JD.cust# and
IC.prod# = ID.prod# and JC.prod# = JD.prod# and
IC.prod# <> JC.prod# and
C.cust# < D.cust#;</pre>
```

Query 4.

List customers who own items in all the available colours. That is, for every available colour, the customer owns some item in that colour.

```
select cust#, cname
    from Customer
except
select C.cust#, C.cname
    from ( select D.cust#, A.colour
                from Customer D,
                     Avail_Colours A
            except
            select I.cust#, I.colour
                from Item I
         ) as M,
         Customer C
    where C.cust# = M.cust#;
```

Query 5.

List each customer by name, paired with the product(s) by name that he or she has bought that was the most expensive (cost) of all the products he or she has bought.

Query 6.

Show, for each customer, the total cost he or she has paid for products in his or her favourite colour.

Query 7.

Report with columns cust# and colour for each customer which colour he or she has spent more on products of that colour than on products of any other colour.

```
with
    Colours (cust#, colour, total) as (
        select I.cust#, I.colour, sum(P.cost)
        from Item I, Product P
        where I.prod# = P.prod#
        group by I.cust#, I.colour
    ),
    :
}
```

Query 7. (p.2)

```
with
:
    Most (cust#, highest) as (
        select C.cust#, max(C.total)
        from Colours C
        group by cust#
    )
:
```

Query 7. (p.3)

```
:
select C.cust#, C.cname, R.colour, M.highest
  from Customer C, Colour R, Most M
  where C.cust# = R.cust#
  and C.cust# = M.cust# and
     R.total = M.highest;
```

Query 8.

What is the total each customer has spent on items *since* his or her most expensive purchase? In case of ties for the most expensive purchase, count since the *first* most expensive purchase.

Query 8. (p.2)

```
with
   First (cust#, when) as (
       select I.cust#, min(date_sold)
           from Item I,
                Expensive E,
                Product P
           where I.cust# = E.cust#
             and I.prod# = P.prod#
             and P.cost = E.cost
           group by I.cust#
```

Query 8. (p.3)

```
:
select C.cust#, C.cname, sum(P.cost) as total
  from Customer C, Item I,
        Product P, First F
where C.cust# = I.cust#
  and C.cust# = F.cust#
  and I.prod# = P.prod#
  and I.date_sold > F.when
  group by C.cust#, C.cname;
```

Query 9.

Which pairs of customers own at least twelve products in common?

Query 9. (p.2)

```
select C.cust#, C.cname,
       D.cust#, D.cname
    from Customer C, Customer D,
         Owned P, Owned Q
    where C.cust# = P.cust#
      and D.cust# = Q.cust#
      and P.prod# = Q.prod#
      and C.cust# < D.cust#
    group by C.cust#, C.cname,
             D.cust#, D.cname
    having count(*) >= 12;
```

Query 10.

Query 5 again: List each customer by name, paired with the product(s) by name that he or she has bought that was the most expensive (cost) of all the products he or she has bought.

Hey, but you have aggregation now!

```
with
    Expensive (cust#, highest) as (
          select I.cust#, max(P.cost)
          from Item I, Product P
          where I.prod# = P.prod#
          group by I.cust#
)
:
```

Query 10. (p.2)

```
:
select C.cname, P.pname
    from Customer C, Item I,
        Product P, Expensive E
    where C.cust# = I.cust#
    and C.cust# = E.cust#
    and I.prod# = P.prod#
    and P.cost = E.highest;
```

Recursion: E.g., Bosses

```
with
    Boss (emp#, boss#) as (
        select emp#, boss#
            from Employee
        union all
        select E.emp#, B.boss#
            from Boss B, Employee E
            where E.boss# = B.emp#
select E.emp#, E.name as ename,
       B.boss#, F.name as bname
    from Boss B, Employee E, Employee F
    where B.emp\# = E.emp\#
      and B.boss# = F.emp#;
```

Counting (w/o Aggregation!)

```
with
    First (a, b, r#) as (
         select a, b, 0
             from Data
         except
         select Y.a, Y.b, 0
             from Data Y, Data Z
             where (Y.a > Z.a) or
                  ((Y.a >= Z.a) \text{ and } (Y.b > Z.b))
```

Counting (p.2)

```
with
   Counter (a, b, r#) as (
       select a, b, r#
           from First
       union all
       select D.a, D.b, C.r# + 1
           from Counter C, Data D
           where (D.a > C.a) or
                ((D.a >= C.a) and (D.b > C.b))
```

Counting (p.3)

```
select a, b, r#
   from Counter
except
select M.a, M.b, M.r#
   from Counter M, Counter X
   where M.a = X.a
      and M.b = X.b
      and M.r# < X.r#
order by a, b;</pre>
```
